This is a two-part presentation on Sensory Processing Disorders (SPD), which are associated with significant problems in adaptive behavior and participation in daily life activities. Children and adults with sensory processing difficulties often suffer from impaired self-esteem, anxiety, depression, or aggression, that result in problems in social participation, self-regulation, and impaired sensorimotor skills needed for daily life tasks.

When sensory disorders are looked at as non-compliance or bad behavior the outcomes can include:

Seclusion/Restraint

Punishing token economies

Meltdowns

Aggression

Police Involvement/Criminal Charges/Incarceration

Hospitalization

An overview of sensory areas and tools to support a sensory diet will be covered.
